Exercises File IO

Exercise

Write a Python program to read an entire text file. The file could be as follows :

Contents of text.txt

What is Python language?
Python is a widely used high-level, general-purpose, interpreted, dynamic programming language.Its design philosophy emphasizes code readability, and its syntax allows programmers to express concepts in fewer lines of code than possible in languages such as C++ or Java.
Python supports multiple programming paradigms, including object-oriented, imperative and functional programming or procedural styles. It features a dynamic type system and automatic memory management and has a large and comprehensive standard library.

```
def file_read(fname):
        txt = open(fname)
        print(txt.read())

file_read('test.txt')
```

Exercise

Write a Python program to read a file line by line and store it into a list.

```
def file_read(fname):
        with open(fname) as f:
                #Content_list is the list that contains the read lines.
                content_list = f.readlines()
                print(content_list)

file_read('test.txt')
```

Exercise

Write a python program to find the longest words.

```
def longest_word(filename):
    with open(filename, 'r') as infile:
              words = infile.read().split()
    max_len = len(max(words, key=len))
    return [word for word in words if len(word) == max_len]

print(longest_word('test.txt'))
```

Exercise

Write a Python program to get the file size of a plain file.

```
def file_size(fname):
        import os
        statinfo = os.stat(fname)
        return statinfo.st_size

print("File size in bytes of a plain file: ",file_size("test.txt"))
```

Exercise

Write a Python program to assess if a file is closed or not.

```
f = open('abc.txt','r')
print(f.closed)
f.close()
print(f.closed)
```

Exercise

Write a Python program to remove newline characters from a file.

```
def remove_newlines(fname):
    flist = open(fname).readlines()
    return [s.rstrip('\n') for s in flist]

print(remove_newlines("test.txt"))
```
